To whom it may concern:

Notification of change in description of power consumption

On behalf of the management and staff of Taiyo Electric Ind. Co., Ltd, we thank you for your continued support of goot soldering equipment and accessories.

We would like to inform you that the indication of power consumption on our stickers has changed.

Years ago, this soldering iron's heater bobbin (cylindrical metal around which the nichrome wire was wound) was changed from iron to stainless steel, to improve the life of the nichrome soldering iron heater. This improved the heat transfer efficiency of the heater calorific value to the tip.

At that time, there was a choice of increasing the heat capacity by changing the tip size, or reducing the power consumption. After considering the compatibility of the tip, we chose to reduce the power consumption.

Unfortunately, the original power consumption figure was retained in our product descriptions and catalogs. Recently this error was caught and changed in our Japanese-language publications, but the correction was not applied to our publications in other languages.

This amendment is to the indication of power consumption only; there is no change to product specifications.

As always, soldering work can be performed without any trouble. Please continue to use goot products with full confidence.

We appreciate your kind understanding.
